

Workstream 1 - Executive Diagnostics Brief

Project 5: Jio Subscriber Churn Intelligence & Revenue Protection | Base: 64,738 subscribers

Executive Summary

Portfolio-wide 30-day churn stands at **1.73%** across 64,738 subscribers, translating to an estimated **■0.3 crore** of annualised revenue (ARR) at risk. **5 circle(s)** are classified High-Risk (>2% churn), led by **Uttar Pradesh East**. Churn accelerates sharply once subscribers cross the **90+-day** recharge-silence window, and low-ARPU / low-tenure segments show materially higher price sensitivity. Network friction signals (congestion, drop-calls, unresolved complaints) further compound retention risk.

Strategic Context: ARR Exposure & Share Transfer Dynamics

Against a current active base of approximately **533,929,773** subscribers, cumulative MNP activity recorded **85,160,642** port-in and **102,250,369** port-out requests over the observed period - a **net outflow of 17,089,727 subscribers**, indicating competitive share pressure that compounds the **■0.3 crore** organic churn exposure quantified above. Protecting the 5 High-Risk circle(s) is therefore the highest-leverage lever for both organic retention and inorganic (MNP) share defense.

Section 1: Circle Risk & Recharge Hazard Diagnostics

Circle Risk Heatmap (Subscribers Avg ARPU Churn % ARR Exposure Cr)				
Uttar Pradesh East	5699.0	213.7	2.8	0.0
Madhya Pradesh & Chhattisgarh	4384.0	213.2	2.5	0.0
Bihar & Jharkhand	4788.0	212.6	2.4	0.0
Uttar Pradesh West	3672.0	214.5	2.4	0.0
Assam	1179.0	215.5	2.4	0.0
Haryana	1922.0	211.7	2.0	0.0
Punjab	2018.0	216.0	1.9	0.0

Circle Risk Tier Summary

Circle	Risk Tier	Subscribers	Avg ARPU (INR)	Churn %	ARR Exposure (Cr)
Uttar Pradesh East	High-Risk	5,699	214	2.77%	0.04
Madhya Pradesh & Chhattisgarh	High-Risk	4,384	213	2.49%	0.03
Bihar & Jharkhand	High-Risk	4,788	213	2.44%	0.03
Uttar Pradesh West	High-Risk	3,672	215	2.40%	0.02
Assam	High-Risk	1,179	215	2.37%	0.01
Haryana	Moderate-Risk	1,922	212	1.98%	0.01
Punjab	Moderate-Risk	2,018	216	1.93%	0.01
Odisha	Moderate-Risk	2,055	212	1.75%	0.01
Rajasthan	Moderate-Risk	3,714	212	1.72%	0.02
West Bengal	Moderate-Risk	3,274	214	1.68%	0.01

Circle	Risk Tier	Subscribers	Avg ARPU (INR)	Churn %	ARR Exposure (Cr)
Andhra Pradesh & Telangana	Low-Risk	4,371	216	1.42%	0.02
Kolkata	Low-Risk	1,381	213	1.38%	0.00
Gujarat	Low-Risk	3,679	212	1.36%	0.01
Tamil Nadu	Low-Risk	4,441	216	1.33%	0.02
Karnataka	Low-Risk	4,050	215	1.23%	0.01
Maharashtra & Goa	Low-Risk	5,457	214	1.23%	0.02
North East	Low-Risk	631	210	1.11%	0.00
Delhi NCR	Low-Risk	2,242	213	1.07%	0.01
Kerala	Low-Risk	2,604	211	0.96%	0.01
Jammu & Kashmir	Low-Risk	524	210	0.95%	0.00
Mumbai	Low-Risk	2,044	211	0.88%	0.00
Himachal Pradesh	Low-Risk	609	219	0.66%	0.00

Strategic Recommendations - Workstream 2 (Predictive Modeling & Uplift)

1. Build a subscriber-level churn propensity model (gradient boosting / logistic baseline) using recharge-gap, ARPU-band, tenure, device type, and network-friction features identified here as the core signal set.
2. Prioritise a proactive save-desk trigger at the recharge-silence inflection point, targeted first at High-Risk circles to defend the largest share of ARR exposure.
3. Layer an uplift-modeling (treatment-effect) approach on top of the propensity model to target retention offers only at subscribers who are both high-risk and responsive to intervention, avoiding margin erosion on already-loyal, low-ARPU segments.
4. Route unresolved-complaint and SLA-breach cases into the same retention workflow, since service friction shows a clear, addressable amplification effect on churn probability.
